Civil Aeronautics Manual 14

Introductory Note

Civil Aeronautics Manuals are published by the Civil Aeronautics Administration to supplement and explain the Civil Air Regulations. This manual contains rules, policies, and interpretations of the Administrator of Civil Aeronautics which pertain to the current requirements of Part 14 of the Regulations of the Civil Aeronautics Board, as amended to May 18, 1954. This manual will be revised from time to time as a result of amendments to Part 14, and as new manual material is found necessary to keep the public informed on acceptable means of showing compliance with the requirements of Part 14.

CAA *rules* are issued pursuant to authority conferred upon the Administrator in the Civil Air Regulations. Such rules are mandatory and must be *complied with*.

CAA *interpretations* define or explain words and phrases of the Civil Air Regulations. Such interpretations are for the guidance of the public and will be followed by the Administration in determining compliance with the regulations.

CAA *policies* provide recommended methods of complying with the Civil Air Regulations. Such policies are for the guidance of the public and are not mandatory in nature.

The Administrator's rules, interpretations, and policies set forth acceptable procedures and practices for the guidance of the public in complying with the regulations. Other methods or practices which provide equivalent safety to those specified by the Administrator will also be acceptable. Any provisions which are shown to be inapplicable in a particular case may be modified upon request.

Part 14 of the Civil Air Regulations, available from the Superintendent of Documents, Government Printing Office, Washington 25, D. C., should be inserted in front of the Table of Contents and should also be consulted when using this manual. The Administrator's sections pertaining to a particular section of Part 14 are identified by consecutive dash numbers appended to the regulation section numbers. Thus, 14.10-1 means the first section of the Administrator's sections pertaining to 14.10 of the Civil Air Regulations.

This manual supersedes Civil Aeronautics Manual 14, Aircraft Propeller Airworthiness, dated May 1, 1946.

Aircraft Propeller Airworthiness

14.1-1 *Definitions (CAA policies which apply to sec. 14.1).* Those technical terms used in the CAM material implementing this part which have special meanings are listed and defined as follows:

(1) *Blade angle.* This is the acute angle between the blade reference station airfoil section chord line and the plane of rotation. The blade reference station is normally located at 75 percent of the blade radius.

(2) *Manifold pressure.* The absolute pressure in inches of mercury in the intake manifold of the engine is the manifold pressure.

(3) *Maximum continuous rating.* This rating is composed of the power and r. p. m. limits for which the propeller is certificated for continuous operation.

(4) *Pitch.* The distance the propeller would advance in one revolution if it were moving along a helix having an angle equal to its blade angle is the geometric pitch of the blade.

(5) *Power.* This is the brake horsepower (b. hp.) delivered by the engine to the propeller.

(6) *Shank.* Shank is that portion of the blade which is used to attach the propeller blade to the hub. In the case of a fixed-pitch propeller, the term "shank" applies to that portion at which the blade fairs into the hub.

(7) *Takeoff rating.* This is a rating composed of the power and r. p. m. limits for which the propeller is certificated for takeoff.

14.14-1 *Type design data*¹ (CAA policies which apply to sec. 14.14). The data specified in paragraphs (a) through (i) of this section constitute the type design data which should be submitted in complying with section 14.14.²

(a) *Parts list.* No parts list need be submitted for fixed-pitch propellers. For all other

type propellers, two copies of the parts list should be submitted, one copy of which, upon certification of the propeller, will be sealed and returned to the manufacturer.

(b) *Drawings.*

(1) For fixed-pitch propellers, two sets of drawings should be submitted, one set of which will be sealed and returned to the manufacturer upon certification of the propeller.

(2) Only one set of drawings for propellers other than the fixed-pitch type should be submitted by the manufacturer.

(3) The following drawings should be submitted. Other drawings in lieu of those listed are acceptable provided they disclose the same information.

(i) Complete propeller assembly.

(ii) Hub assembly.

(iii) Hub.

(iv) Blade retention structural parts.

(v) Blade assembly.

(vi) Blade design (if not disclosed in the blade assembly drawing).

(vii) Pitch control assemblies (if not disclosed in the propeller or hub assembly drawings).

(viii) Schematic pitch control diagram.

(ix) Such other drawings as the Administrator may find necessary to determine compliance with the requirements of this part.

(c) *Production specifications.*

(1) Specifications covering all materials used in the manufacture of the propellers.

(2) Specifications covering all processes used in the manufacture of the propellers.

(3) Military or SAE specifications need not be submitted, but should be referred to in all drawings and materials and process specifications where applicable.

(d) *Type test report.* The type test report, suitably identified by title and number and signed by a responsible representative of the applicant for the type certificate, should cover the items listed in this paragraph. The appli-

¹ Vibration stress data is not acceptable for determining the airworthiness of a propeller with respect to power and r. p. m. ratings since vibratory stresses bear no relationship to the steady stresses present during operating conditions.

² The initial request for approval of a propeller should be accompanied by at least the drawings specified in section 14.14-1(b)(3)(i), (vi), and (viii), stress analyses as discussed in section 14.14-1(f) where applicable, and the proposed test program as specified in section 14.16-1.

cant's report number should appear on all pages of the report.

(1) Conclusions and/or recommendations for operating limitations, if any.

(2) Description of propeller, including all accessories, such as governor and synchronizer.

(3) Summary of test conditions and log. The report need not contain the complete test log.

(4) Calibration of test instruments when necessary.

(5) Test engine specification. At least enough information to unquestionably identify the engine, including such information as complete model number, takeoff and maximum continuous ratings and reduction gear ratio.

(6) Description of test setup if other than established test stand.

(7) Test irregularities, failures and forced stops due to the propeller.

(8) Description of the condition of the propeller at the teardown inspection, including the results of magnetic particle, dye penetrant, fluorescent penetrant and X-ray inspections.

(9) Changes in the propeller during testing and proposed changes as a result of testing.

(10) If the approved version of the propeller differs from the prototype (i. e., the test propeller) parts lists for both propellers should be included in the test report and appropriately identified.

(11) Photos of failed or worn parts of the test propeller. Photos of the assembled test propeller if it is unconventional or has special features. Photos of the test rig if other than established test stand.

(e) *Other reports.* The applicant should submit reports covering any special tests that may be required by section 14.155.

(f) *Stress analysis.* A stress analysis may be acceptable in lieu of type tests for a propeller which incorporates major components similar to those in an applicant's previously certificated propeller. The analysis should present a comparison of stresses in the new propeller to those in the older propeller.

(1) For a propeller which incorporates a hub similar to one previously certificated, and previously certificated blades, the analysis should include:

(i) Total bending moment and total

centrifugal force which the blade imposes on the new hub and the old hub.

(2) For a propeller which incorporates blades similar to ones previously certificated, and a previously certificated hub and pitch changing mechanism, the analysis should include:

(i) Combined stresses for several stations along the blade for the new blade and the old blade.

(ii) Total centrifugal force twisting moments at representative blade angles for the new blades and the old blades to demonstrate the relative loading of the pitch change mechanism.

(iii) Total bending moment and total centrifugal force which the new blades and the old blades impose on the hub.

(g) *Reversible propeller failure analysis.* The failure analysis covered by section 14.103-1 should determine what types of failures or malfunctions are most likely to occur to all components of the reversing system, should disclose how such failures or malfunctions affect propeller pitch, and what design feature prevents unwanted travel of the propeller blades to a position substantially below the normal flight low pitch stop.

(h) *Flight time data.* Where acceptable in the type certification of a propeller, flight time data should include a copy of the flight log certified to by the person flying the aircraft, and a statement of the estimated number of hours operated both at the maximum continuous rating and at the takeoff rating. The data should also include the model designations of the aircraft, the engine, and the propeller.

(i) *Referral to data previously submitted.* In lieu of submitting all of the data required for a new approval, the applicant may refer to data previously submitted by him, or if he is the holder of a current right to the benefits of a previous approval or type certificate, he may refer to data previously submitted in connection with such approval or type certificate. In any case the applicant should identify the data referred to and establish that they are pertinent and equivalent to the data required for the new approval.

14.14-2 *Data required for military propellers.* (CAA policies which apply to sec. 14.14). In

addition to data specified in section 14.14-1 (a), (b), (c), (e), and (g), the applicant should submit the data specified in either paragraph (a) or paragraph (b) of this section.

(a) A copy of the official report which forms the basis of military approval.

(b) A letter from the military which includes the following information:

(1) Identification of the propeller.

(2) Identification of the engine upon which the endurance test was run.

(3) Duration and r. p. m. of overspeed test.

(4) Duration and rating at which the normal-rating endurance test was run.

(5) Duration and rating at which the flash performance endurance test was run.

(6) Number of pitch change cycles accomplished.

(7) Number of feathering cycles accomplished.

(8) Number of reversing cycles accomplished.

(9) Results of teardown inspection.

(10) Operating limitations if any.

14.16-1 *Required tests (CAA policies which apply to sec. 14.16)*. The applicant should submit for approval his proposed type test program. The data submitted should include:

(a) How each test will be conducted.

(b) Identification of propeller and accessories being tested.

(c) Identification of engine used.

(d) Location of tests and teardown inspection.

14.16-2 *Testing facilities (CAA policies which apply to sec. 14.16 (a))*. The testing equipment available for conducting the tests specified in sections 14.151 through 14.155 should be:

(a) An engine capable of developing at least the power and speed for which certification of the propeller is desired.

(b) A suitable engine mount.

(c) An accurate tachometer, which should be calibrated before and after testing or checked with a stopwatch and revolution counter during testing.

(d) A suitable manifold pressure gage if the test is not run at full throttle (not required for fixed-pitch wood propeller tests). The manifold pressure connection should be permanently

located so that the manifold pressure is a uniform indication of power. All test values should be on a basis of dry absolute manifold pressure which is obtained by subtracting the vapor pressure from the observed absolute manifold pressure.

14.16-3 *Propeller operating limitations³ (CAA policies which apply to sec. 14.16 (c))*.

(a) The following operating limitations will be established as determined from tests conducted for type certification:

(1) Maximum continuous power and r. p. m.

(2) Takeoff power and r. p. m.

(3) When applicable, avoidance of continuous operation at or between certain r. p. m.

(4) When applicable, special limitations imposed due to functional or structural considerations, such as minimum engine oil pressure necessary and life limit.

(b) Requests for increases in power and/or r. p. m. ratings up to a maximum of 10 percent above the values substantiated by actual tests, provided there are no structural changes in the propeller, should be accompanied by substantiating test data or stress analysis as covered in section 14.14-1 (e), (f) and (h). Requests for increases greater than 10 percent should be substantiated in a manner satisfactory to the Administrator.

14.100-1 *Design features (CAA policies which apply to sec. 14.100)*. Where applicable, the propeller should incorporate design features to comply with the requirements of pertinent portions of Parts 3 and 4b of this subchapter, regarding feathering and unfeathering, r. p. m. governing, de-icing, low pitch stops, r. p. m. and pitch controls, feathering controls, and reversing controls.

14.103-1 *Reversible propeller failure analysis (CAA interpretations which apply to sec. 14.103)*. The words "reversing system" apply to the portion of the complete propeller reversing system incorporated into the propeller itself, and to the portions supplied by the applicant for installation into the aircraft. (For require-

³ The operating limitations together with diameter and pitch limits and general specifications for the propeller are published in the form of propeller specifications. (See Figures 1, 2, and 3.) Propeller specifications are available free of charge from the Civil Aeronautics Administration, Aviation Information Office, W-47, Washington 25, D. C.

ments with regard to the failure analysis, see sec. 14.14-1 (g).)

14.150-1 *Essential accessories (CAA policies which apply to sec. 14.150)*. All accessories and appurtenances intended for use with the propeller should be included in the tests required in sections 14.153, 14.154 and 14.155. These accessories and appurtenances include, but are not limited to:

- (a) Propeller spinner.
- (b) Propeller brakes.
- (c) Propeller cuffs or fairings.
- (d) De-icing fluid slinger rings.
- (e) De-icing fluid distributing strips.

14.151-1 *Centrifugal load test*⁴ (*CAA policies which apply to sec. 14.151*).

(a) *Whirl test*. The complete propeller, or the propeller hub with weighted stub blades, may be used in this test. If stub blades are used, they should produce the required centrifugal force at the test r. p. m. Any type of motive power may be used for this test. The propeller may be reduced in pitch any amount so as to reduce the power if desired.

(b) *Static pull test*. Stub blades used for this test need not be formed into airfoil sections, but should be flared out to provide adequate holding means to insure that any failure will occur in the blade retention arrangement.

14.153-1 *Endurance test (CAA policies which apply to sec. 14.153)*. Endurance block tests should take into account air temperature, barometric pressure, humidity, engine manifold pressure or torqueometer or torque reaction stand readings, and engine r. p. m.

(a) *Continuity of test*. The endurance test may be continuous or in increments agreed upon between the propeller manufacturer and the Administrator.

(b) *Power output*. The engine power output should be at least equal to the manufacturer's official ratings (hp. and r. p. m.).

(1) The engine power output should be determined on torque reaction test stands, by calibrated propellers or by engine torqueometers.

⁴ So that it will not be necessary to repeat this test for new blade designs which would impose greater centrifugal loading on the retention system, it is suggested that the test selected be conducted at the greatest centrifugal loading anticipated.

The double centrifugal force loading for this test, the purpose of which is to substantiate the structural integrity of the blade retention arrangement, is based on the maximum continuous r. p. m. for which the propeller is to be certificated.

If a torque reaction stand is not used, an engine torqueometer should be used for power monitoring during the test.

(c) *Forced stop*. The test should be terminated upon evidence of any unusual vibration, hunting or noncontrollability of the propeller, a change in power or r. p. m. not attributable to general atmospheric conditions or any change in the readings descriptive of the propeller during the testing.

(1) The test should be terminated when any failure of the propeller or its essential accessories would result in an immediate forced landing of an aircraft. The failures should be corrected to the satisfaction of the Administrator before official type certification testing is resumed.

(2) The failure of the test stand equipment or engine accessories is not a forced stop.

14.156-1 *Teardown inspections (CAA policies which apply to sec. 14.156)*. The teardown inspection is one of the means for determining the airworthiness of the propeller and compliance with the requirements of this part. As a result of the inspection the administrator may require such revisions to the design or additional tests to establish the airworthiness of the propeller before approving the issuance of a type certificate.

(a) *Wood or composition propellers*. Wood propellers or those with blades of composition or of other than conventional wood or metal construction should be thoroughly examined for evidence of loosened or excessively cracked tipping, opened glue joints, cracks in the wood, local failure or cracking around the hub bolt holes, and slipping or crushing around the shank. Some flexural cracks in the metal tipping is considered normal. Plastic covered propellers should be inspected for cracks in the covering which would indicate a cracked lamination or open glue joint. Failures of these types are cause for the refusal to issue a type certificate.

(b) *Variable pitch propellers*. No vital part of the propeller should bear evidence of fatigue cracks or wear which would necessitate altering or replacing such part. Wear measurements should be made on parts that are visibly unduly worn. All unduly worn or cracked parts should be photographed for further study in determining the airworthiness of the propeller. No

parts of the propeller should show evidence of impending failure.

(c) *Hub and control mechanism.* All ferrous parts of the hub and control mechanism should be given a magnetic particle inspection. All aluminum parts should be carefully inspected for cracks by a suitable process such as etching, anodizing, fluorescent penetrant or dye penetrant.

(d) *Aluminum alloy propellers and blades.* Aluminum alloy propellers or propeller blades should be thoroughly inspected for cracks and material defects by a suitable process such as etching, anodizing, fluorescent penetrant or dye penetrant. Particular attention should be

given to critical sections such as fillets and points of abrupt curvature. The blades should then be inspected for cracks with a 4 to 6 power magnifying glass.

(e) *Steel blades.* Hollow steel blades and solid steel blades should be given a thorough visual and magnetic inspection for cracks and material defects in accordance with the manufacturer's established procedures and specifications. The magnetic inspection should be made only by a highly skilled operator. Any magnetic indication should be discussed with a representative of the Administrator since such indication may warrant a complete metallurgical examination.

PROPELLER SPECIFICATION

Propellers of models described herein conforming with these specifications and approved data on file with the Civil Aeronautics Administration are rated as airworthy for use in certificated aircraft in accordance with pertinent aircraft specifications and applicable portions of the Civil Air Regulations.

The propellers are of two-bladed, laminated wood construction, either varnished or plastic covered, with metal tipping. The takeoff rating is ten percent in excess of the maximum continuous rating. Propeller weight does not include the metal hub. The weight of metal hubs is given on the pertinent engine specification. These limitations apply to all propellers listed herein except as modified in the notes.

Manufacturer: Green Manufacturing Company, Anyville, Michigan

PROPELLER SPECIFICATION NO. XXX Excell 227 Page 2 of 3 pages

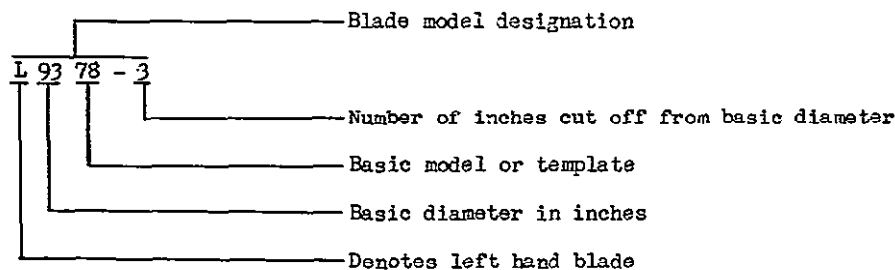

P-XXX-6

NOTE 1. Propeller Model Designation. The model designation of a complete propeller assembly (which includes all parts mounted on the propeller shaft except the spinner and governor) consists of a number suffixed to the basic model designation. For example:

A change in the suffix number indicates a design series change which may affect eligibility.

NOTE 2. Blade Model Designation.

NOTE 3. Pitch Control. Eligible with Excell manual or constant speed control. Constant speed control includes the Excell governor Model A-1. Additional weight of governor is 3.75 lbs.

NOTE 4. (a) Feathering. Eligible with full feathering control installed in accordance with the propeller manufacturer's instructions.
(b) Reversing. The -500 and -600 models incorporate hydraulically controlled reversing.

NOTE 5. Left Hand Models. The left hand version of an approved model propeller is eligible at the same rating and diameter as listed for the right hand model. (See NOTE 2.)

NOTE 6. Interchangeable Blades. Only blades listed in the same group of the following listed groups are sufficiently similar aerodynamically and vibrationwise to permit interchangeability in the same diameter without a flight test. Blades with different model numbers should not be incorporated in the same propeller and reference should always be made to the ratings of the blades.
Group (a) 7425, 7438.

NOTE 7. Accessories.

- (a) Propeller spinners.
 - (1) Eligible with Excell spinners. Additional weight 3 lbs. The -700 model includes a spinner.
- (b) Propeller de-icing.
 - (1) Aluminum alloy blades eligible with Goodfield 38053 fluid feed shoes, or Goodfield "Iceno" shoes, when applied in accordance with Goodfield instructions.
 - (2) Eligible with Excell de-icing slinger ring assemblies only.

NOTE 8. Not applicable.

NOTE 9.

Table of Propeller-Engine CombinationsApproved Vibrationwise for Use on Single-Engine Tractor Aircraft

The maximum and minimum propeller diameters that can be used from a vibration standpoint are shown below. No reduction below the minimum diameter listed is permissible, since this figure includes the diameter reduction allowable for repair purposes.

<u>Blade Model</u>	<u>Engine Model</u>	<u>Max. Dia. (Inches)</u>	<u>Min. Dia. (Inches)</u>	<u>Placards</u>
7425	Brown B-310	74	72	Never exceed 2750 rpm.
7652	Brown B-310	76	72	None.
8482	National F-960	84	82	None.
	National F-970	84	80	None.
	National F-980	84	82	None.
8848	Brown B-350	88	86	None.
	Brown B-370	88	86	None.
9378	National F-990	90	88	None.
	Brown B-370	93	91	Avoid cont. eng. operation between 1675 and 2160 rpm and between 2900 and 3200 rpm.

NOTE 10. Special Limits. The -600 and -700 hubs can be used only on installations with power-plant oil pressure of 50 psi or above.
